Does your infant have a visual impairment?

We want to know how babies learn words!
We're looking for babies age
14-26 months with profound visual
impairments to participate in our studies.

Duke CHILD Studies

What's involved?

One visit to the Duke Child Studies. You would fill out some questionnaires about your child's language development. During the experiment, your child would sit on your lap and wear a cap to measure brain activity while hearing some words.

Why participate?

Your participation would help us understand how babies learn words. You would be compensated $40 per hour, and your child would receive a gift!

Duke Child Studies is located on Duke's West Campus.
